0146 STEEL BLUE

Color Kicker:

See the other side of this sheet for a simple way to double this color palette!

Nothing says "water" like glass! And nothing says springtime like the bright pure colors of this palette.

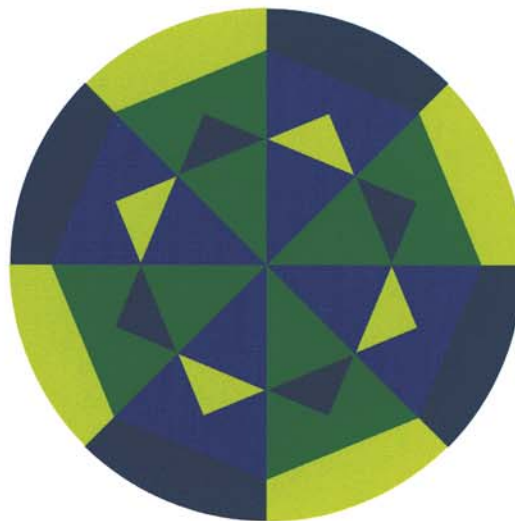

But watch for surprises beneath the placid surface: 0146 Steel Blue is a remarkable glass that stays blue when fired under a transparent glass—or when overglazed—but may turn metallic gray if fired uncovered. We've buried it deep in the interior of our Kicker tile to keep it blue.

But you might want to bring it to the surface and watch what happens.

Still more choices

We've used the thin, 1.6mm, glass for the color parts of our Kicker tile, but for additional variations in saturation, consider using more 3mm glass.

For texture and surface interest, you might include frits, stringers and confetti in your designs. See what's available in the chart below:

Single-rolled, 3mm
Double-rolled, 3mm
Thin, 1.6mm
Frit and powder
Confetti
Stringer
Rod
Irid coating

Color Kicker:

1408 LT. AQUAMARINE BLUE

Still waters run deeper and deeper. AQUAMARINE BLUE is a soft blue/green transparent made from copper. Its cousins in our line are the paler 1808 Aqua Blue tint, and the deep 1108 Aquamarine Blue. With this broad a color family, the depth of this palette is unmatched.

Family feud?

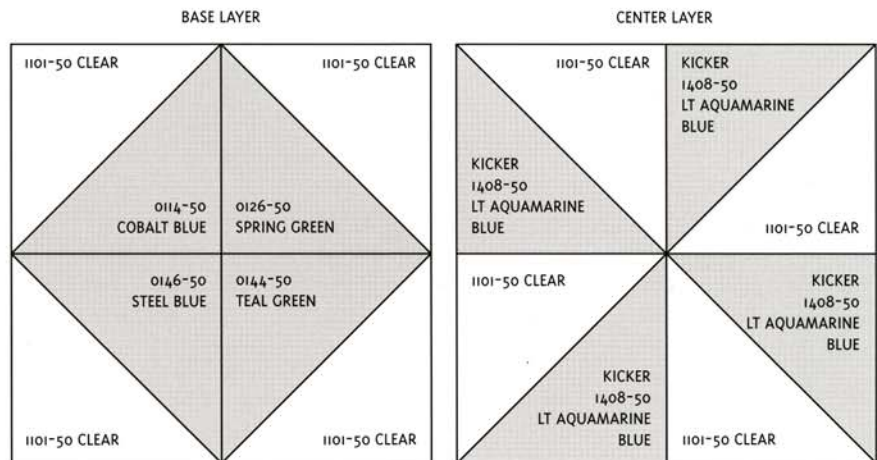

Lurking beneath the gentle 1408 layer of our Kicker tile is a fine, dark line created by the color reaction between the copper in our 0144 Teal Green and the sulphur in our 0126 Spring Green. Even in the best of families...

The tile lay-up

We created our tile using 3 layers of Bullseye Compatible glass:

- A base of thin (-50) colors and clear
- A center layer of thin (-50) color and clear
- A top solid layer of standard clear 1101-30

This total thickness (6.2mm) should not flow out or shrink appreciably when fired to a full fuse. If you are stacking higher, use dams to maintain your original footprint.
